*Medicine adds days to life,
Physical Therapy adds life to days.*

Here to Serve

A physical therapist may improve your patient's:

Comfort and well-being: Cancer and its treatments can cause pain, burning sensations, numbness, tingling, cramps, spasms, and weakness.

Lymphedema and swelling: Certain cancer treatments can result in lymphedema (swelling in the arms or legs) or other types of swelling. Your physical therapist can use methods to control and prevent these issues. Certified Compression garment fitter.

Daily activities: Your physical therapist will discuss activity goals with you and use them to design your treatment program.

Balance: Your physical therapist will examine your balance, and choose specific exercises that you can perform to improve your balance and prevent falls. Your physical therapist may also teach you how to use a cane or walker to help maintain your balance.

Oncology Rehabilitation Physical Therapy

What is Oncology Rehabilitation?

Kirkland Cancer Center Physical Therapy is a medical specialty focused on the prevention, diagnosis and nonsurgical treatment of disorders associated with disability, such as cancer. Our therapist is here to provide care for patients with musculoskeletal disorders and chronic need rehabilitation services. Our goal is to restore optimal patient function in multiple life dimensions, including medical, social, emotional and vocational.

"Felicia has gone above and beyond to help me and I am very grateful for her help. Very grateful for West Tennessee Healthcare and their services."

When is the best time to Receive Oncology Rehabilitation?

Rehabilitation can occur throughout the course of the disease. There are four types of rehabilitation:

Preventative Rehabilitation: before or immediately after cancer treatment to prevent loss of function

Restorative rehabilitation: comprehensive restoration of function for patients who have completed treatment but have a disability.

Supportive rehabilitation: to increase self-care and mobility in patients with progressive cancer and a disability.

Palliative rehabilitation: to help maintain comfort or function in patients with terminal disease.
